

MOHAMMAD ABUMARAR

Full Stack Software Engineer

Amman, Jordan | mo.abumarar@gmail.com | +962787548772 | [LinkedIn](#) | [GitHub](#) | [Portfolio](#)

PROFESSIONAL SUMMARY

Full Stack Software Engineer with hands-on experience designing and building scalable, production-grade web applications and developer tooling. Specialized in React, TypeScript, Django, and RESTful API development, with practical exposure to AI/ML integration (NLP, scikit-learn), Docker-based deployment, and cloud platforms. Passionate about clean architecture, performance optimization, and delivering user-focused solutions.

PROJECTS

Intelligent Task Allocation System (ITAS) | Graduation Project

GitHub: <https://github.com/Abumarar/Intelligent-Task-Allocation-System-ITAS->

Tech Stack: Python, Django, Django REST Framework, React, TypeScript, Vite, Tailwind CSS, PostgreSQL, Redis, Docker, scikit-learn, spaCy, recharts, JWT, GitHub Actions

- Architected a decoupled full-stack enterprise application to optimize software task allocation within IT organizations using AI-driven matching algorithms.
- Built a RESTful API in Django DRF with JWT authentication, Role-Based Access Control (RBAC), and atomic database transactions ensuring data integrity.
- Engineered an embedded scikit-learn ML pipeline that classifies tasks, predicts required roles from CV content, and computes suitability scores fusing CV skillsets with historical performance evaluations.
- Integrated spaCy-based NLP CV parser to extract candidate skills, experience, and role predictions from uploaded PDF/DOCX files via a dedicated API endpoint.
- Implemented a Dynamic AI Matching Decay system using an exponential time-decay function that penalizes inconsistency and weights recent task performance evaluations over static CV data.
- Developed a Performance Task History Profile enabling Project Managers to rate granular skills (1–5 scale) per completed task, feeding live data back into the AI matching engine.
- Built interactive data visualization dashboards using recharts (Skill Usage History, Rating Progress Bars, Performance Evolution line charts) inside large modal analytics views.
- Containerized the full stack (frontend, backend, PostgreSQL, Redis) with Docker Compose; configured a CI/CD pipeline via GitHub Actions running pytest, black, and isort on every push.
- Deployed backend to Render (gunicorn + Django production settings) and frontend to Vercel with environment-based API URL injection.

Abumrium – Developer-Focused Desktop Browser | Personal Project

GitHub: <https://github.com/Abumarar>

Tech Stack: Electron 33, React 18, TypeScript, Vite, Tailwind CSS, Zustand, CodeMirror 6, electron-vite, electron-builder, Node.js

- Designed and built a production-ready desktop browser using Electron (Chromium), targeting developer workflows with built-in tooling replacing external apps.
- Implemented multi-tab browsing with per-tab container isolation using separate Electron session partitions (Default, Admin, User, Guest) — cookies and storage fully isolated per session.
- Built a full-featured API Lab (HTTP client supporting GET/POST/PUT/PATCH/DELETE) with headers editor, request body editor, response viewer (pretty/raw), save/load requests, and copy-as-cURL.
- Developed JSON Tools with paste-and-format, minify, validation with line-level error reporting, automatic TypeScript interface generation, and Zod schema generation from arbitrary JSON.
- Created a live Regex Lab with pattern/flags input, highlighted match rendering, capture group display, and a library of built-in snippets (Email, URL, UUID, Date, Hex Color).

- Built a Localhost Radar that scans common dev ports (3000, 5173, 8080, etc.) and performs heuristic-based framework detection via header/body pattern matching.
- Implemented a lightweight Request Inspector per tab (method, status, URL, type, duration, text filter) with a privacy-safe design — no request/response bodies or auth headers logged.
- Developed an Error Lens engine capturing console errors from web pages, detecting patterns (CORS, CSP, Mixed Content, 404, WebSocket), and providing human-readable explanations.
- Implemented a fully keyboard-navigable Command Palette (Ctrl+Shift+P) with 15+ commands, a Header Rules editor for per-domain request header injection, and settings export/import as JSON.
- Enforced Electron security best practices: contextIsolation: true, nodeIntegration: false, typed and validated IPC channels, no telemetry, and all user data stored locally.

EDUCATION

Bachelor of Software Engineering | *Philadelphia University, Jordan* | 2022 – 2026

TECHNICAL SKILLS

- **Frontend:** React, Vue.js, Angular, TypeScript, JavaScript (ES6+), HTML5, CSS3, Tailwind CSS, Bootstrap, Vite, Zustand, React Query, recharts
- **Backend:** Django, Django REST Framework, ASP.NET Core, Node.js, RESTful API Design, JWT Authentication, RBAC
- **AI / ML:** scikit-learn, spaCy, NLP, CV Parsing, ML Pipelines, AI Matching Algorithms
- **Databases:** PostgreSQL, SQLite, Redis, Entity Framework Core, Django ORM
- **DevOps & Tools:** Docker, Docker Compose, GitHub Actions (CI/CD), Git, Vercel, Netlify, Render, Postman
- **Architecture:** MVC, Repository Pattern, Component-Based Architecture, Decoupled Full-Stack, REST
